EVERY WEEK PROG ILLUST

CHASE THEMSELVES AROUND THE WORLD

M INNEAPOLIS.—Last Thursday night WAMM attempted to get a long distance record by racing in themselves. They hoped to hear their own program as it reached them around a world race, having passed over Asia and Europe and sailed across two oceans and several lakes. The operators, skilled directors, and assembled guests became so confused by signals and static that were unable to tell whether they heard an outgoing or an incoming program.

LECTURES ON EVOLUTION

ASKS LEGAL ACTION TO SILENCE STATION

NEW YORKER HOLDS WNYC POLITICAL MOUTHPIECE

Says Mayor Uses Municipal Station to Broadcast Propaganda at City's Expense

By Jack Forrest

NEW YORK.—Action has been started by the Citizens' Union of this city to close the municipal broadcasting station, WNYC, on the grounds that it is being used by Mayor Hylan for disseminating political propaganda.

Application for the closing order was made by Leonard M. Wallstein, counsel for the Citizens' Union, based on affidavits of Henry Fletcher, vice-chairman of the organization. The court's order requires the mayor and Commissioner Moynihan, joint defendants, to show cause why an injunction should not be issued against the further operation of the station.

Three grounds, justifying a court order for closing the station were cited by Mr. Wallstein.

"First, the city is without legal authority to spend money for the purchase, construction or operation of a broadcasting station.

"Second, the law makes no provision for the broadcasting of propaganda on behalf of the defendants or any other person or persons.

"Third, such acts constitute a waste of city funds and other property of the city of New York and cause an irreparable injury to the city."

When the station was opened a little more than a year ago at an estimated cost to the taxpayers of \$80,000, the then commissioners of parks and structures, Grover Whalen, speaking for the mayor, issued a statement in which he said:

WJR, NEW DETROIT PLANT, OPENS SOON

STATION OF JEWETT RADIO HAS 5,000-WATT RATING

Transmitter Is Located in Pontiac, Michigan; Studios Are in Automobile City

DETROIT.—The inaugural program from WJR, the new 5,000-watt broadcasting station of the Jewett Radio and Phonograph company, located at Pontiac with central studios here, will be worthy of the station's ideals; and the date—August 13—should be marked down on the listeners' calendar as one of the important ones of the summer season.

Beginning at 7 o'clock in the evening, the best talents available will pass before the microphone in the studio of the station at the Book-Cadillac hotel. A varied entertainment of character and appeal will be provided.

One of the features to be presented to the radio audience will be the Detroit Symphony orchestra, generally conceded as one of the finest symphonies in the country.

HARVARD MAN TO BROADCAST BASIC THEORY

Man Comes From Ape

Professor Holds Man Can Believe Darwin and Still Be a Christian

BOSTON.—Dr. E. A. Hooton, professor of anthropology at Harvard University, will endeavor to explain the theory of evolution to radio listeners in an hour's lecture which will be broadcast from Westinghouse Station WBZ Friday evening, August 7.

Dr. Hooton will go on the air at 3 o'clock. Every time, and although it will be impossible to cover at length this totally interesting and absorbing subject in such a short time, he will endeavor to his vast audience the basic facts of the evolution theory.

"One of the greatest events in the history of the world took place when the ancestors of man descended from the trees and started to walk on their hind legs," declares this noted scientist, who demonstrates how changing methods of moving about, of fighting and of living

(Continued on page 23)

These people say that Chicago ladies do funny things when they try garments but after looking at the little lady pictured above you will have to admit that the body of Windy City men who pronounced Mary Bragdon guilty of being pretty enough to warrant the title of "Miss Chicago" and "Miss Illinois" in a recent contest, were correct in their decision. Miss Bragdon is heard frequently from WGN. Madeline Olga Petrova Goff, now appearing in "Murderous," recently talked about the stage from WGN. Madeline Halister (right) is oft times heard from WGN.

BROADCASTS APE TALK

(Continued from page 11)
are believed to have altered geological structures in such ways were abandoned.

New Use of Hand-Aided Man

The rising of man's ancestor to his last aid in his progress in many ways, according to Dr. Boston, and by a chain of circumstances it indirectly brought about a condition which allowed his brains to grow.

To begin with, his hands were freed from the business of locomotion. They were used for grasping food and aiding in his enemies. The result was that his jaws were released from their Andrews later as weapons. This gradually resulted in jaws causing less pressure of weight on the cranium at Dr. Boston's moderate by enlargement of the skull and jaws or the other primates at least with those of man, in whom he will endeavor to explain his most unusual condition, which is broadened jaws.

Many people feel that the evolutionary theory should not be taught—that it is a slow climb of their religion. They regard evolution as dangerous to human form who would take from them the last vestige of the faith which comforts their souls and substitutes a mechanical, materialistic code.

Religious Groups Fight Antisurgery

Dr. Boston earnestly urges the logic of their attitude. He holds that religion has no real quarrel with antisurgery.

"I do not regard evolution as a religious dogma or as a political theory," says this prominent scientist. "One does not believe in facts—no accepts them; it is evolution and religion in two different categories; one is an interpretation of facts, the other a belief in certain supernatural phenomena, an emotional response to them. And I consider that a wide dissemination of the facts of evolution would remove the fear of hellfire in the minds of men, than perhaps I would agree with those who oppose its teaching."

"I feel that a man can honestly accept the facts of evolution, and at the same time, be devout to Christianity and guide his life by its principles."

The chief complaint of the extreme fundamentalists is that the study of evolution is destructive of religion. That is that Doctor Dr. Heslop has given his answer and expressed a viewpoint held by many people who are both intelligent and religious.

ACTS AGAINST STATION

(Continued from page 1)

"Editorial writers are now concerning themselves with possible release of the broadcasting station. Let me assure these gentlemen no administration would be bold enough to invade the sacred precincts of the homes of its people with any political propaganda. The programs broadcast from the municipal station must first of all be of a very high-class character; they must be free from politics; they must be educational and instructive."

1932 WNYC Budget \$44,000

Lee J. McDermott, an attorney associated with Mr. Walston, sets forth in an affidavit of many pages the history of WNYC. He shows that in addition to the original cost of the station, its maintenance and personnel service, salary had grown until the 1932 budget called for \$44,000 yearly. Mr. McDermott, after charging that the station is used mainly for political propaganda, says:

"As to the proposed use of this station for the purpose of the fire department, I do not find that there is even a pretense that it has ever been used for such a purpose. An inspection of the many programs published for Station WNYC discloses nothing whatever relating to the fire department."

"As in the supposed police department's use of such broadcasting station, dependent has often listened to the broadcasting of said Station WNYC, and although he has heard the broadcasting of the so-called police drama, has never received any broadcasting from said station which in his opinion was of any real value as a police department activity."

In explanation of this action, the Citizens' Union made a public statement, in which it said:

"The maintenance of the broadcasting station at city expense for any purpose, except the use of the Citizens' Union, is unauthorized by law. But if the city officials had used it properly, merely as an adjunct of the police department, or even for the broadcasting of music and educational non-political talk, no objection would have been made."

Boost Greater Movies by Radio

NEW YORK—In connection with the "Greater Movie Season" movement all the orchestra and artists of Broadway's picture palaces suited up in grand Radio pageant which was broadcast by New York stations last week. In addition to this association talent, many celebrities of national prominence appeared before the microphone.

McNAMEE REMAINS LEADER IN CONTEST

EASTERNER TOPS G. D. HAY
BY NEARLY 18,000 VOTES

Fourth and Fifth Place Holders Have
Changed; Barnett Seems to
Help Leader

Only three more ballots counting the ones submitted above to be mailed for the next announced and the 1932 Gold Cup contest will be decided. At present, through McNamee, WHAP, is still leading the field and seems to be gaining more strength with each trip of the mailman to the Digest office.

George Hay, WLS, is now over 17,000 votes behind the leader and unless there is a sudden arrival of votes from the great unknowns when the earliest draw is a close last year's cup winner's only chance to see the cup will be when it leaves Chicago on the Century 21 way to Madison. However, it must be remembered that the 46,000 bonus that goes to every batch of 22 consecutively numbered ballots may have much to do with altering the final standing.

Barrett Meets to Help

That Stanley Barrett is making good his promise to help from getting votes and throwing his support to McNamee is evidenced by his dropping to 5441 since among the eleven leaders and having added but two votes to his last week's total.

Goss Barnes is still in the third position but his shift of last week has not carried through into this week with as much strength as before. The Woodmen's announcer added some four thousand votes last week but only managed to boost his total by 1,000 in the latest round.

First Hand Gossip

Down Texas way things are beginning to pick up and the third hand of WHAP is catching on. Henry Field, KFNT, who holds the fourth position by barely over two hundred counts. The come out in low gear growing rapidly now and it may be that the farmers are too tired when evening comes to listen in on the Sherman-dash station and hear Field. At the same time, though, it looks like the Fort Worth station will go off the air for a period while they are completing their new station. In this case, the third hand will not be heard for several evenings and the lone word mat may have an opportunity to strengthen his hold on fourth place.

Many stations are boasting their own announcements in replies to fan letters and there is a possibility of swaying the fans toward a dark horse when the time comes to submit the bonus votes. In that case the thoughts on the story announcing the choice for the next announcement may contain a name never before mentioned there.

Last Pages Again

There have been no new contestants to break into the leader group but unless some of these dawn towards the bottom of this list do not watch out someone may come up from the unlisted boat below in time to be counted in the final standing and thus receive the certificates of merit. These certificates will be awarded this year as fast to the fifteen announcers immediately below the winner.

Although "Bill" Hay, formerly of KFNU, has severed his connection with the advertising end of Radio and is no longer heard from the journalization he still continues work on the air. He was recently heard from WLS, where George Hay introduced him.

Frank Lane, KPHU, and H. W. Aron, KEDLA, age winning neck and neck down

at six and seven. Lane passed Aron in the balloting of the past week.

M. Dean Cole, WHO, took quite a jump and placed Lambdin Kay again. Cole is now tenth and Kay is eleventh. The only other change in standing occurred at the bottom of the list when O. R. Becker went past Barnett to thirteenth place.

The latest standings are:

Position	Name and Station	Votes
1	George Hay, WLS	46,000
2	Stanley Barrett, WHAP	17,000
3	Goss Barnes, KFNT	5,441
4	Henry Field, KFNT	4,250
5	Frank Lane, KPHU	3,800
6	H. W. Aron, KEDLA	3,600
7	M. Dean Cole, WHO	3,500
8	Lambdin Kay, WHO	3,300
9	John C. Barnett, WHAM	2,800
10	John E. Becker, WLS	2,700
11	Frank L. Johnson, KFNU	2,600
12	W. C. Gilligan, KFNU	2,600
13	John E. Becker, WLS	2,500
14	John C. Barnett, WHAM	2,400
15	John E. Becker, WLS	2,300
16	John C. Barnett, WHAM	2,200
17	John E. Becker, WLS	2,100
18	John C. Barnett, WHAM	2,000
19	John E. Becker, WLS	1,900
20	John C. Barnett, WHAM	1,800
21	John E. Becker, WLS	1,700
22	John C. Barnett, WHAM	1,600

Looking Ahead

A Bridge Circuit from Nicaragua will be presented in the next issue, together with detailed instructions for building a set incorporating it. While Mr. H. N. Skeeter, who sent in the idea, had not read Milo Gurney's article, his hook-up forms a bridge that permits of high amplification.

WHAS, "Down in Old Kentucky," will be pictured and described in the next issue of Radio Digest. The Courier-Journal and Louisville Times station has made its city famous for something besides Derby and Colonels. Pictures of the studio and members of the staff will be shown.

The End Is Close in the Gold Cup Contest, and the next to the last ballot will appear next week. The contest closes August 22, and if you want to see your favorite at the top of the list do not fail to do so and send the next two ballots.

Single Circuit Set Owners Will Be Interested in the non-endearing stage of used R. F. that will be outlined next week by Mr. J. A. Thatcher of the Toronto Radio Research society, as it aids admittance and range, yet eliminates them as offenders in the matter of whistling interference.

Characteristics of the Three Electrode Tube form the basis of Professor Morison's next article of the A. H. C. Series. The beginner in Radio is often confused by such terms as Mutual Conductance, Amplification Constant and Plate Impedance. Here is a chance to have their significance cleared up.

NEWS BRIEFS FROM THE BROADCASTERS

INVITE MONKEY TRIAL MEN TO SPEAK FROM SHOW

Cuba Joins Argentine to Entertain Army Band Heard on Four Station Hook-up

Officials of the Radio World's Fair have invited Bryan and Darro to use their special broadcasting hook-up to address 25,000,000 people on the question of radio during the show in New York.

Maria Montez, pre-eminent danseuse; Juan Pujol, Spanish recording baritone of the National theater; Havana, Cuba, and Carlos Capetillo Argentine orchestra combined to delight WOR afternoon listeners recently.

New York, Washington, Philadelphia and Providence heard the music of the United States army band on July 28, when it was broadcast from WEAF, WCAF, WOR and WJAR from 7:30 to 9 p. m., Eastern daylight time. Capt. William J. Standard conducted the concert, playing in the army barracks, Washington.

A series of golf talks from Station WZWL of the United States Playing Card company, Cincinnati, are being given Wednesday evenings by George Bowden, professional at the Mokewauke Country Club, Cincinnati. Mr. Bowden is one of the leading professionals in the United States.

On August 3 Station 2LO, London, will transmit the first real broadcast play ever produced in Britain. It is a mystery play in modern style by a new author, with the underlying motive of the Chinese raving through it.

A novel feature of the ten weeks series of band concerts given by the Goldmark band on the campus of New York university will be an "tournament for Boys" bands to be broadcast through WEAF and others on Friday, August 14, beginning at 9 p. m.

During the absence of Mrs. Ellen Root Dibny, board adviser of the South Dakota Agricultural Foundation on her vacation, her work over WLD will be carried on by Mrs. J. C. Soddy, of Brookings, S. D. Mrs. Soddy, who is a graduate of the South Dakota Agricultural college, has been instructor in home economics for five years at the high school at Clark, S. D.

Hawaiian music never, especially popular in summer with the Radio audience, so Misses HEKA gave another of its series by the KDMCA Hawaiian players on August 5.

Open-air band concerts and special late dinner programs during the next two months are the newest entertainment features to be staged for long distance Radio listeners by KOA, Rocky Mountain broadcasting station of the General Electric company at Denver.

Of special interest in the Northwest was KPOA's recent program which had for its principal吸引 the principals in the year's production of "The Wayfarer," being held at University of Washington stadium in Seattle.

Kelvin Tewesuk, an Indian singer who has been a WLEB solo artist, broadcast recently from KJR, Seattle. Steven Oliver, an Eskimo player from Unalaska and Tewesuk's partner, accompanied the singer.

"Radio Brassens," by Kenneth C. Boston, known to millions of newspaper readers as H. C. B., is now heard as a regular KGO Tuesday evening feature. H. C. B. with guest B. C. O.

Two new ideas are to be broadcast from KTCH, Seattle. One is a "friendly aid" service which is to be directed by George H. Crandall, well-known lawyer. The service will offer friendly advice and counsel on legal troubles that concern the public. The other feature is known as the "Voice of Seattle" and will be broadcast from a downtown street intersection. Harold Gramm, program director of KTCH, will give a description of the streets of Seattle and several novelties are to be introduced.

Universal Company Takes Over WCAU, Philadelphia

PHILADELPHIA.—Station WCAU, located at the Hotel Pennsylvania, formerly operated by Durbin and company, has been taken over by the Universal Broadcasting company. Stanley A. Brown, a member of the firm, well known in broadcasting circles, has been appointed director of studio and programs, and has arranged some elaborate new features and surprises for the Radio audience for the coming season.

ABDEL KRIM WANTS RADIO—NO CAN DO!

PARIS.—A neutral journalist who has recently returned from a visit to Addis, the capital of the Riff, noticing that the Riffian method of communication between general headquarters and local commands was the field telephone, asked him what he did not use Radio also. The Riff Sultan replied: "In the first place I have no apparatus. I dare say I could get that easily enough, but I have as yet no person who understands the working of Radio."

CHASE THEMSELVES AROUND THE WORLD

MINNEAPOLIS.—Last Thursday night WAMD attempted to set a long distance record by racing themselves. They hoped to hear their own program as it returned from around the world via, having passed over Asia and Europe and sailed across two oceans and several lakes. The operators, station directors, and associated guests became so confused by signals and static they were unable to tell whether they heard an outgoing or an incoming program.

GRACE DRAYTON IN RADIO DEBUT

It is well and fitting that the first talk over the Radio to the kiddies given by Grace Drayton from WMECA should be entitled "Loving Children." She has won international fame as an artist with her "Kiddie" drawings, verse, and prose.

Why Worry About Time Used When We Work It Out For You Weekly?

DENVER, Colo.—Broadcasting experiments at Denver further reveal that static is not the only problem of Radio fans.

To compute the current time elsewhere and to know where and how to calculate differences between Eastern, Central, Mountain and Pacific coast time, to say nothing of daylight savings, when "DIXIE" is a unique problem in itself.

The puzzle is made all the more complex by the growing number of broadcasters. Government records it is said, now indicate in excess of 160 stations in this country alone.

"How many hours difference between here and Honolulu, Chicago and Dallas, Alaska and Richmond, Va?" are typical of the many questions raised by inquirers among KOA's audience.

Atmospherics, science professors, railroad officials and weather forecasters, as well as broadcasting officials, declare an everlasting avalanche of time-questions

has been raised since the overwhelming popularity of Radio as a summer diversion.

"I am a profound Radio enthusiast," reads a recent communication to the General Electric station at Denver from a student of a leading western university. "My greatest bugbear, however, is knowing when to listen for a 10 o'clock program in Wisconsin or a 6 p. m. program in Mexico."

"I am fully aware that 6 p. m. in London and Paris is around 15 o'clock noon, Standard time, in New York, 10 a. m. in Beaver and 8 a. m. in Ogallala, Calif., but how am I to know which of the other cities are embraced in the Eastern time group and which in the Central, Mountain and Pacific coast groups?"

"The time standards in use by each station is listed in the 'Broadcasting Stations' list, published weekly by Radio Digest on the next to last page.—Editor's Note.)

WJR, NEW DETROIT PLANT, OPENS SOON

STATION OF JEWETT RADIO HAS 5,000-WATT RATING

Transmitter Is Located in Pontiac, Michigan; Studios Are in Automobile City

DETROIT.—The inaugural program from WJR, the new 5,000-watt broadcasting station of the Jewett Radio and Phonograph company, located at Pontiac with control studios here, will be worthy of the station's ideals; and the date—August 15—should be marked down on the listeners' calendar as one of the important days of the summer season.

Beginning at 7 o'clock in the evening, the test latest available will pass before the microphone in the studio of the station at the Book-Cadillac hotel. A varied entertainment of character and appeal will be provided.

One of the features to be presented to the Radio audience will be the Detroit Symphony orchestra, generally conceded as one of the finest symphonies in the country.

Music Team Radio City

At the time the orchestra is broadcast it will be playing in a new 450,000 seat which was built this summer on the city's beautiful Belle Isle park, in the Detroit River. This program will be followed by a varied studio entertainment presenting vocal and instrumental groups assisted by vocal and instrumental artists. During this studio program a number of famous men will be presented in short talks incidental to the inauguration of the station.

Popular entertainment will have its place on the program, since it is the station's intention to please every member of the Radio audience, and in following out this intention it is necessary to present all of the various entertainment suited to broadcasting.

WJR is the station; 7 p. m., Eastern time, is the hour; 517 meters is the wave length, and 5,000 watts the power; the date—August 15.

'BIG BROTHER' ON VAUDEVILLE BILL

Bob Emery Shows Boston Keith's Audience How He Entertains Kiddies

BOSTON.—For the first time so far as is known, a Radio announcer has had a week's engagement at R. E. Keith's theater in Boston. On July 27, Bob Emery, Big Brother to 35,000 members of the Boston Elks' Big Brother club, took the microphone at WERB studio for one week to meet the children face to face on the stage and show his audience how he entertains the kiddies nightly at WEEZ.

The routine of Big Brother's act consisted of a brief sketch of motion pictures showing views of the recent Big Brother club outing, including scenes,等一系列，and a brief Radio sketch in which Bob Emery was the principal.

The Radio sketch was entitled "The Program Director," it was in two parts and depicted the troubles of a program director in his office and then some of the trying situations in the studio before the microphone. This sketch was written by Charles Burton, superintendent of broadcasting at WEEZ, showing the Radio audience exactly how broadcasting is done. The audience not only saw it in action on the stage, but heard from Emery himself exactly how his voice comes to them over the air.

New Stations

WGSI is the new Florida station which has been puzzling fans for the last few weeks. This new 500-watt Western Electric station, operating on 884.4 meters, is located at Gulfport, Fla.-the-Sea, nine miles north of WMBF, Miami Beach. The chief announcer is Robert H. Nolan.

WGAI, Philadelphia, formerly operated by Durbin and company, is now owned and operated by the Universal Broadcast company.

The following limited commercial class "X" stations were licensed into use: KPO, Head River, Ore., 188 watts, 176 meters; KPCO, Stevens, Mont., 10 watts, 348 meters; KJWO, Avalon, Calif., 380 watts, 111.5 meters.

San Francisco is to have its first superstation when KPO, Hale Brothers, goes on the air soon with its new 4,000-watt transmitter.

'BWS' LEAVING WOC FOR EASTERN 'MIKE'

PALMER SCHOOL TO LOSE
POPULAR ANNOUNCER

Stanley W. Barnett Goes to Baltimore
Soon to Help Start New
Power Plant

DAVENPORT, Iowa.—According to an announcement made public here by Dr. D. Palmer, School of Chiropractic, Stanley W. Barnett, studio director of Station WOC, and known to the radio audience as "Announcer BWS," has resigned his position with the Chiropractic Foundation Radio-Phone station, the resignation to become effective next time in August. According to his present plans, he will connect with a new high-power station which is under construction in Baltimore, Md., and which will go on the air about October 1. The Gas and Electric company of Baltimore will operate the new station. It will have a capacity of 5,000 watts.

Patrick H. Huber, manager of the station, is continuing the policy and:

"Everything that is of the best in Baltimore will be broadcast. Baltimore's best instrumental and vocal talent, best attractions, her best artists. It may be that the Baltimore Symphony orchestra, the Park band and the Municipal band may give concerts. Or, some of our leading organizations or members of the Peabody conservatory faculty. Now, advertising at the Johns Hopkins university can be given to the world through us. The possibilities of our new station are unlimited."

With WOC Over 2 Years

Mr. Barnett has been connected with Station WOC since its inception three and a half years ago, and has seen one of the best and most powerful stations grow up from a small, insignificant beginning, and in this development "BWS" has played a very prominent part. WOC, about eight months ago, installed the latest type 5,000-watt transmitter.

When interviewed at WOC recently concerning his change, Mr. Barnett stated that for some time he had felt a desire to make a change, preferably, to be nearer his former home in Pennsylvania.

"You know," he said, "you folks never go to bed at night without hearing me sign off at WOC, and I really get to miss them on account of the distance and the time that I would be absent from the station at WOC."

"What are your other reasons?" he was asked.

"Well," he confided with pleasure, modesty. "I have been told that I have played a responsible part in making WOC's organization, reputation and service record of service. What it is, and when I was approached by another radio station to do the same thing for them, and in view of the other factors, I decided to make the change, much as I dislike the idea of leaving WOC, Davenport, and all the friends I have among the station staff, and the artists who frequently come here. As for the radio audience, I don't think they will miss me so very much because I will be on the air again within a few weeks, and they and I will stay there in order to renew our acquaintances. I really believe, though, that I personally, will feel the change much more than the listeners it will feel," he concluded.

Sorry to Lose "BWS"

When Dr. R. J. Palmer, president of the Palmer School of Chiropractic, was interviewed concerning Mr. Barnett's resignation, he stated that while sorry to lose the services of "BWS" he was at the same time glad that Mr. Barnett was being called upon to help in building up a similar organization in another part of the country. In regard to the future personnel at WOC, Dr. Palmer stated that they were at present selecting from a number of applicants a man who would satisfactorily fill the position of announcer and who, at the same time, would be as highly acceptable and pleasing to the radio audience as was Mr. Barnett.

"We also intend to put on several new features in our broadcasting program which we feel sure our radio audience will find more than ever attractive, pleasant and profitable. It will be some days, however," concluded Dr. Palmer, "before we shall be in a position to make public our choice of a successor."

Before venturing to the Palmer School of Chiropractic—from which, incidentally, he is a graduate, besides being their chief announcer at WOC, and one of the greatest announcers in the country—Mr. Barnett was a first-class electrician (Radio) in Uncle Sam's navy, and saw service during the World war.

Landlord Cannot Refuse Radio

VENICE.—The right of a tenant to receive a receiving outfit despite the opposition of his landlord was the subject of a recent test action in the Austrian courts and resulted in the complete victory of the tenant.

BIDS WEST GOODBY; GOES TO BALTIMORE

Stanley W. Barnett, former "Announcer BWS" of WOC, at Davenport, Iowa, has resigned from his post there to take a position with the new 5,000-watt station of the Gas and Electric company at Baltimore, Md. The new station will take the air October 1, it is planned.

WIP to Have Home on \$18,000,000 Building

Gimbels Brothers Soon to Start
New Store

PHILADELPHIA.—Gimbels Brothers of this city, operators and owners of Station WIP, are having plans prepared for the erection of a 1,000-watt station on the roof of their new twelve-story department store building, occupancy of which starts soon. The building will cost \$18,000,000.

Richard Glissel, a member of the firm, and who has taken an active interest in the operation of the station, has made a tour of all the principal stations of this country and abroad in an effort to learn just what will make WIP one of the most attractive, as well as most powerful, broadcasters in the United States. Edward A. Curtis, director of WIP, states that the new station will be put in operation as soon as the new building is completed.

JACK DEMPSEY HELPS OPEN NEW WOK STUDIO

Terrace Garden Is Site of New
Hotel Plant

CHICAGO.—WOK, at Homewood, a suburb near here, opened its new Chicago studio in the Terrace Garden, American hotel, recently and celebrated its increase in power with a dinner-dance for friends and radio artists.

One special feature was a talk by Jack Dempsey.

The station is owned by the Northwest Radio company and has 5,000-watt equipment. Only 1,000 watts will be used for the time being. Batteries supply the transmitting power.

George W. Allen, a new voice to Radio, is announcer and director. Harry Water, formerly at WIST, is assistant director and announcer. Robert North, pianist, who has been heard from many stations, is also on the station staff.

Silver Cup Is Award for Most MacMillan Messages

NEW YORK.—A silver cup has been offered as a trophy to the amateur Radio operator who picks up the largest number of messages from the Macmillan expedition from now until September 15, by the Second Radio World's Fair, through E. J. Harmsen, managing director. It is letters addressed to the National Geographic society and the Amateur Radio Relay League.

Preferred

IT IS no accident that more Eveready Radio Batteries are purchased by the radio public than any other radio battery made.

Such complete and voluntary endorsement can lead to but one conclusion—for best reception and longest life, Eveready Radio Batteries lead the field.

You can prove this for yourself by hooking Eveready Radio Batteries to your set. You will find that they deliver a steady, vigorous stream of power that lasts longer. It is Eveready economy that has created such an overwhelming preference for Eveready. For every radio use there is a correct, long-lasting Eveready Radio Battery. There is an Eveready dealer nearby.

EVEREADY Radio Batteries

they last longer

WEAF, "Chief of the Link Stations"

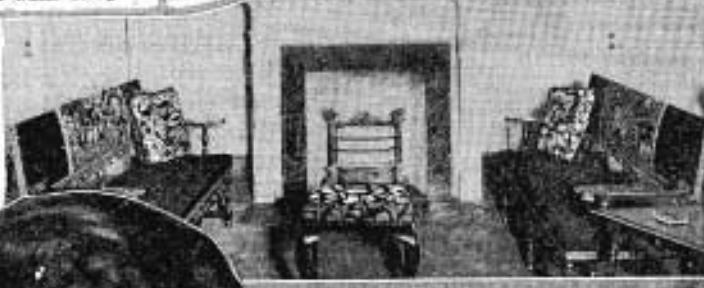

The input control board where voices from the microphones are amplified and relayed by phone to the WEAF studio.

Two views of reception room. See in the upper photo leads to studio pictures at page bottom.

"Sounding" Betty Louis, the charming day announcer at WEAF.

Here is one of the most popular quartets ever heard in America, the four gentle announcers of WEAF. At the top is Graham MacNamee, whose voice has been heard over as many as fourteen stations at one time and who has hosted the Gold Cup Anniversary contest here for weeks. Next we have Phillips Carlin, also heard over the WEAF link. He always smiles they say! The gentleman with the dreamy eyes always radiates joy over the "enthusiastic" stations he visits. Below is Leslie Joy. At the bottom is James Henry, who has made good use of his excellent musical education to make the programs so interesting.

No wonder WEAF's voice is always cheery. Look at the atmosphere.

Left, Betty Stewart (top) and Kathleen Stewart (bottom) are evening hosts on WEAF.

EMBODDING the latest developments in studio acoustics, in studio arrangement and every technical improvement in broadcasting equipment, WEAF's studio and remote control facilities in New York city, are the last word in this important phase of broadcasting.

Years of broadcasting by WEAF have indicated desirable features in studio design, which improves the quality of Radio programs. Minutiae attention to detail is responsible for much of the improvement in aesthetics of the improvement. The parquet floors are laid in place and are insulated from the walls of the studio. Voice walls are used between the studios and the hall to introduce a dead air space, making them practically impervious to sounds of the hall.

The draperies on the walls are arranged so that they can be adjusted to give the correct degree of shading for the particular media being transmitted. For instance, heavy bands require more shading than a quartet or a pianist. A speaking voice requires the least shading for good transmission. In every case the studio director can make his corrections and adjustments without loss of time.

The paramount feature of the studio installation is the use of two studios, a small one for singers, speakers and small groups of instruments and a second large studio for bands, large choruses and orchestras. Between the two

studios is the monitoring booth from which the programs are directed.

WEAF has four announcers on the staff. They are well known to the audiences throughout the country, due to the linking of stations with WEAF for their varied programs. When you hear "Good evening, ladies and gentlemen of the Radio audience," you can be sure that it is the voice of Graham MacNamee, ready to deliver his announcement of the forthcoming attraction. He has covered most of the national events that have been broadcast through WEAF, and is noted for his well modulated voice. To him falls the honor of announcing the Wednesday hour and variety presentations.

To those who are familiar with the introductions and announcements of "The Man in the Silver Mask," the "Silvertone Card Orchestra," or the "Happiness Candy Boys," the voice of Phillips Carlin is a source of real enjoyment. Among many of his friends he is known as the "Orator of WEAF." His smile is reminiscent.

When a solo guest in any of the programs, Leslie Joy, announcer steps in and fills the gap with a tasteful solo. He has had a wide and varied career, though still under thirty years of age.

(This is Part II)

Left, H. E. Ross, director of programs, that are peculiar to WEAF. Right, a glimpse at the corner of one of the principal studios.

At the piano, G. H. MacNamee, who is in charge of the band behind the scenes.

MATRIMONY NOTES SWAMP KOA PLANT

SPINSTERS-BACHELORS, ASK AIRLINE TO ALTAR.

Station Refuses Cupid Role; Requests
Continue to Come from
Coast to Coast

DENVER, Colo.—Radio may be faced with the wholesale responsibility of solving matrimonial problems for enterprising spinster and bachelors of the country, if the strong rush on KOA here is any criterion.

Regardless of growing demands from correspondents in the unmarried class, officials of the Rocky Mountain broadcasting station have adopted the strict matrimonial policy of "hands off." In fulfilling the responsibility of finding mates, likewise, they are holding out hope that the situation will become less acute with the expiration of summer.

COAL LEADS ALL

Ohio ranks first in the number of respondents appealing to the station for guidance in the matrimonial field, with Iowa taking second place and Washington third.

An Illinois girl gives her age as 17 and advises she could settle down with "any man if such a creature exists." She adds further, "I never have been able to find anyone nice yet." A Cincinnati maiden declares she is "very good looking and quite popular among the boys out, and a black velvet cap is to my taste. I suppose I am considered an old-fashioned because my hair is not bobbed."

WOMEN SEARCH THERE

From an Oregon lumber camp a bachelor writes, "Women are very scarce here and I am looking for someone to write to. Please forward some names." An unmarried male KOA asks to supply him with names of pretty Denver girls and Colorado timber wants as far from a girl who cares about living in the country.

A Hartford, Conn., radio correspondent wrote a lengthy letter to the broadcasting station after finishing a book of romance which "has such a beautiful ending," and a Frankfurt, Ky., correspondent advises that she is "just past 18, new and loves music and good books."

Expects Half Billion to Be Spent on Radio

**Radio Fair Head Bases Estimate
on Government Reports**

NEW YORK—Half a billion dollars is likely to be spent by the American public for radio equipment within the next year, in the opinion of U. J. Hermanns, managing director of the Second Radio World's Fair, who bases his conclusions on government reports and the estimates of leading manufacturers.

"One of the greatest gains in radio sales this year will be among the farmers," Mr. Hermanns declares. "A noticeable proportion of our agricultural, for one reason or another, was slow in developing the radio fever; but now Radio has become an indispensable factor of farm life, not only from the standpoint of entertainment and general education but in view of the invaluable information on market conditions and agricultural improvements and advice."

"Everything points to a prosperous year for the farmers. Large sums will be expended in the chief agricultural areas for radio installations."

Mr. Hermanns states that representatives of several leading grain organizations would be in New York the week of September 14-19 to view the exhibits of new radio products at the Second Radio World's Fair in the 23rd Street Artillery Armory, the largest hall in the world.

"Lopez Speaking" Is Again Heard from Manhattan Isle

NEW YORK—Vincent Lopez has returned to the good old U. S. A. and is back on the air again, playing through WLIB every Tuesday, Thursday and Saturday from the roof of the Hotel Pennsylvania.

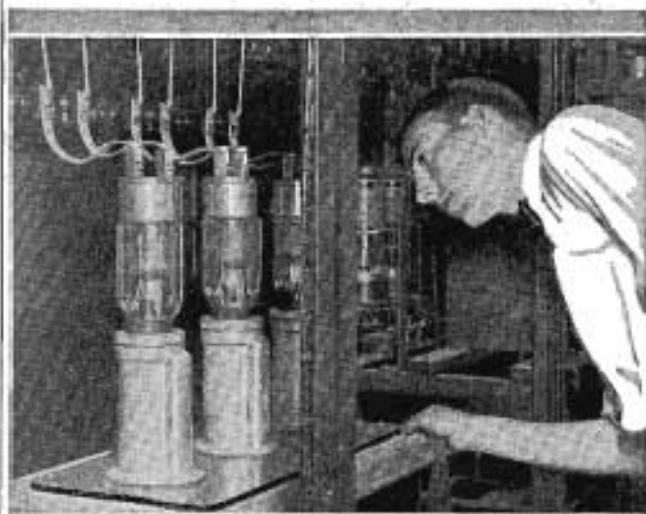

One of the pioneers of broadcasting whose "Lopez speaking" is famous throughout the country, he returned to New York on the 8th U. S. Ferry following an unusually successful engagement at the immense London Hippodrome and at the famous 5th Nat. Hall.

Although the sole attraction in a theater crowded the home of spectator sports, the Lopez orchestra proved a sufficient drawing card to fill most of the 2,400 seats daily.

New Mike at KGB

TACOMA, Wash.—Local Station KGB, by having its station recently overhauled, has added the latest type of improved microphone with accompanying amplifiers. The wave length remains 245.5 meters.

WPL USES WATER COOLED TUBES

Some of the giant water-cooled tubes in the transmitter of Station WPL, the broadcasting plant of the Paulist Fathers, New York city, soon to open at the First Radio church directly connected with the Roman Catholic church.

WEAF, CHIEF OF LINK

(Continued from page 2)

Those who listened to WEAF's "house talent" program which was broadcast by WEAF and seven other stations by WLIB and seven other stations by WEAF were not aware that the entire presentation was conceived by James Haupt, one of WEAF's popular announcers and familiarly known as the "entire staff as just plain 'Jimmie.' His forte is in his fundamental knowledge of music which leads outlet in the planning of such programs as the "Fireman's Hour" and the "WEAF Light Opera Quartet."

Upon entering the reception room at WEAF, a visitor is greeted at the door by Miss Betty Luta. She is the day hostess, and is noted for her charming manner and big smile that is given to everyone. During the evening, Kathleen Stewart and Winifred T. Barr act as hostess-accompanists. Their names are perhaps mentioned more than the call letters of the popular New York station itself.

A large and comfortable reception room with four leading directly into each studio provide a waiting room for a large number of artists. A special lead speaker equipment furnishes them with entertainment while they are waiting for their turn to perform.

The plant department, or transmitting room is adjacent to the studio. Here all single and remote control circuits terminate in a power input panel and are connected with the special use to the transmitter located at West street. A system of adjustable dissipation and works is located in the plant department so that the utilization of lines controlling broadcasting from remote control points can be readily applied for radio broadcasting purposes. All remote control will thus be handled at one point by a specially trained crew.

A special ventilation system has been installed in both studios, which changes the air within them every seven minutes. This assures cool, clean air even in midsummer. In order to eliminate arrest noise during broadcasting the windows in the street may be kept closed without interfering with the comfort of the artists.

All of these facilities result in a marked improvement in the conduct of the programs and practically eliminates long waits between numbers in the programs, and those waits occasioned by switching from one studio to another or to remote control points when broadcasting is done from the outside.

WEAF has broadcast some of the largest and most notable events in the history of the country. The Democratic convention and the inaugural address of President Coolidge being two of the most important.

During the broadcasting of the Defense Day test, broadcasting was accomplished over the largest link of stations that ever was attempted. The success of that test showed the remarkable possibilities of broadcasting when the nation is in the throes of a catastrophe. "The Daddy of 'em all"—WEAF.

The Friends Academy has just decided to add the word "Saint-Gaudens" (four speakers) to the Artillerymen, then broadcasting the name.

ERECT NEW STATION AS A 'TRAFFIC COP'

WILL OBSERVE 'JAMMING' OF EUROPEAN STATIONS

Believe New Detector Plant Will Aid in Clearing up Difficulties of Broadcasters

LONDON.—An investigation station—a sort of central listening post—is the latest development of the British Broadcasting Company for improving and developing the broadcast services both of Great Britain and the continent.

It is being constructed near Bromley, Kent, and will be working in six weeks. It is the first station of its kind to be erected.

By the use of a supersensitive and powerful receiver working on four high frequency, one detector and two low frequency tubes, the station will be able to pick up signals from all continental and many American transmitting stations. It will be able to tell if one station is jamming the transmission from another. By the use of a direction-finding apparatus the operator will be able to tell in a few minutes what stations are at fault.

"Charleston" Taught by Radio in Chicago

Dancing Master Instructs Fans in Fundamentals

CHICAGO.—"The Charleston" in all the go this month. Not the sleepy old town-down Carolina way, but the dance that is said to have originated on the banks of the Allegheny and Cooper rivers that flow past that western Pennsylvania city. In order that Radio listeners might be up to date on this latest dance craze, WEAF, in cooperation with a local morning newspaper, will broadcast lessons telling how the fundamental steps might be mastered. The lessons will be given by the dancing master of the ballroom where the station is located.

Diagrams published in the paper each morning are explained via Radio at 4:30, Central Standard time. By studying the cuts and then listening in on the Radio, all who really care to may learn the dances.

Pittsburghers Seek Time to Search Ether for DX

PITTSBURGH.—This city will have a Radio silent night if the plans of the local Retail Credit Men's Association are carried through to a successful conclusion. This organization has recently formed a committee with a view to bringing about a silent night at least once or twice a month here. It has arranged conferences with other trade bodies and with local broadcasters in order that they can check up on the capabilities of these interests.

Make Sure of Receiving Your Copy Each Week

and receive the best service from Radio Digest. Requests for missing copies are numerous. You cannot afford to miss a single issue. Your best protection is a mail subscription. Now is the time to get on the weekly mailing list.

One of the popular Radio Broadcasting Stations writes:—*** "We find the trouble in this locality is the fact that our listeners are having difficulty in securing copies of Radio Digest." * * *

Many readers miss some of the issues of Radio Digest. It is a disappointment to reach a newsstand sold out. Readers become dissatisfied and Radio Digest loses a reader. Our best efforts are being put forth to have copies always on newsstands. Frankly, we admit that the job is very strenuous.

YOU CAN HELP

Advise us promptly of any difficulty you have in getting your copy. Give us the name and address of the dealer who is sold out.

Your mail subscription will solve your problem.

You will find a coupon in each issue.

Today fill out the coupon and mail at once.

This insures your copy each week, delivered on time.

RADIO MAY HELP IN PASSING NEW LAWS

NEW YORK GOVERNOR USES WGY FOR REFERENDUM

Broadcasting Discussions On Important Legislation Will Obtain Views of Voters for Representatives

SCHENECTADY, N. Y.—The Radio referendum may, in a few years, be presented by legislative enactment. Until the result of such a referendum becomes binding on elected representatives, the Radio appeal for the statement of the views may be expected to have an important part in interpreting the wishes of the electorate and in influencing the action of the law maker.

Governor Alfred E. Smith of New York has several times appealed to the voters on matters of importance to them and he is convinced that Radio broadcasting has entered a new and strenuous field of public service.

Governor Smith says: "The American democracy covers so vast a territory that we must heartily welcome an art that brings its executives and legislators into the most immediate contact with the public they have been elected to serve. The advantage is double. It expedites the sending of an intimate message to the whole body of citizens and it occurs to the speaker a more frank and frank expression of personal opinion than he could obtain in any other way. Thus there is preserved a mutual relationship that is of especially high value as a problem arises which can best be solved by a general meeting of minds."

Officials Close to People

"Recent experiences in broadcasting matters of public interest through the medium of WGY have given me a new sense of close fellowship with my fellow citizens; their many replies have been a help and an inspiration in seeking a solution to the questions which an executive can conveniently answer only in the full light of the common thought."

WGY, one of three powerful stations of the General Electric company, is located at Schenectady, within sixteen miles of the capital of Albany, which is represented in the Radio committee by Wilells. From time to time the governor, legislators and constituents have called on WGY for the privilege of using its facilities to reach the citizenry. Whenever this could be done consistently and with fairness to those already addressed on the program, the Schenectady station has given up the name. The results demonstrate effects worthy talker; the high-speed department, during the summer months, furnishes the automobile corner with a report on road conditions; the agricultural department, as well as the department of farms and forests, issues frequent bulletins of interest to the farmer, including in these bulletins service special harvest weather reports. Last fall when fire in the Adirondack mountains forced a suspension of hunting, WGY was used by the governor and by the conservation commission in warning those already in the woods that an emergency existed and that hunting was banned. One of the first and most interesting of Albany programs was the broadcasting of the inauguration address of Gov. Nathan L. Miller.

Referendum Already Taken

Governor Smith, as well as the Republican leaders whom he has opposed, have recognized the growing importance of Radio in legislative matters and have used the facilities of WGY to take a Radio referendum on pending legislation.

In March of this year when Governor Smith found his plans of a financial program opposed by appealed to the people by Radio discussing the subject, "Borrowing the People's Money." The response from the audience, conveyed directly to the elected representatives, resulted in haranguing the views of the governor and the legislature.

A second Radio referendum on miners' legislative was taken in June after Governor Smith had called a special session of the legislature to reconsider the park program.

Before the legislature convened in special session Governor Smith broadcast his views from WGY. His voice, amplified by the Radio power station, was carried to every part of the state. Wilells also carried it to WJZ, in New York, and this station broadcast the speech. Two nights later Senator John Knight, leader of the majority, replied to the governor and presented his side of the controversy. Still later Judge Alphonse T. O'Rourke, a member of the Niagara State Reservation commission, gave a Radio discussion on the issue.

The voters were thus able to hear both sides of the question and many of them wrote to their representatives in Albany requesting action on one side or the other.

Much of the discussion, however, and possibly in multi-faceted notes can be eliminated by the use of matched tabs.

BEAUTIFUL STUDIO IS INSPIRATION

BEAUTIFUL broadcasting begins with better studios, and that means entertainment and atmosphere," said Louis Conde, E. P. McDonald, Jr., president of the National Association of Broadcasters and the Zenith Radio corporation, "and we propose to prove the point." The new superpower station, WJAZ, of the Zenith company, now being built, will have probably the most beautiful studio in the world. The decorations, painting of the studio, with an inset photograph of Mr. McDonald, are shown above.

After being elevated briskly to the twenty-third story of the new Zenith building, Chicago, where the Zenith studios are located, one first comes into a reception room of unusually spacious dimensions, set with costly tapestries and carpeting and furnished in period furniture. To the right is an artistic archedway within which a massive art metal gate in the exterior, flanked on either side by smaller archedways are wrought iron grilles beneath which artistically built in benches are positioned. This room being given over exclusively as a lounge for visitors and artists.

Passing through a great archedway and into the studio proper one first comes upon a great wide veranda—giving the impression of having left the drawing room of a chateau and all into the garden.

In the center stands a massive art fountain of stone which adds a touch of realism with its tiny spray of water noiselessly sparkling and silverying the Japanese goldfish within its spacious reservoir. The octagonal tiled flooring is here and there offset by an occasional piano seat or other appropriate settings all of which lends a touch of ancient days and a silent effect that plays upon the visitors.

The Zenith Station, WJAZ, however, has not left any details to the artist.

FORD AND GLENN BEGIN TRIP HOME

Lullaby Boys Drive Eastward to WLS and Leave Jazz Behind

CHICAGO—Ford Bush and Glenn Bowell, the Lullaby Boys of WLS, Bear-Rockwood station here, who left in June for the Pacific coast on a tour of the stations, are on their way home to Chicago, where they expect to arrive August 15 and resume their popular programs. It has been announced today by Edgar L. Hill, director of the station.

Ford and Glenn, with their families, started June 2 in two automobiles on their transcontinental trip. On their way to the ocean they broadcast many of their WLS features. From Seattle, where they broadcast over KJR, they have just sent word that the WLS listeners may expect to hear their voices slightly again in Chicago about the middle of August.

Little Glenn writes that he is tired listening to jazz programs in the West. "It's jazz everywhere," says Glenn, "and we found little of the honest interest features we try to give over WLS."

Artificial Larynx in London

LONDON—The most novel mechanical song yet broadcast from a British station was the sound generated on an artificial larynx recently invented by Sir Richard Page, the famous throat surgeon. Sir Richard declares the use of this device will enable dumb people to talk. Thanks to Dr. George Abbott, a wealthy donor, the new "Artificial Larynx" of Sir Richard Page—Singer's Note.

BRITISH ANNOUNCER MUST BE VERSATILE

ENGLISH COMPANY WANTS WELL QUALIFIED MEN

After Landing Position It Is Weeks Before New Announcers Speak Over Microphone

LONDON, Eng.—The British Broadcasting company, which requires several additional announcers, points out that applicants for the place must have very exceptional qualifications. The following are the qualifications the B. B. C. looks for in the ideal announcer:

"He must have a pleasant, refined voice. He must possess a general knowledge of so many subjects as almost to make him a walking encyclopedias. Consequently, university men are most suitable for the work."

"He must have personality so that 2,000,000 listeners receive the impression of having a friendly chat with him."

"He must be able to deal adequately and sympathetically with every subject treated."

"He must be musical and know how to be interesting on such a subject as chamber music, and be able to discuss physics and the hundred and one things that concern the microphone's evening."

"He must keep listeners happy throughout the whole program."

"He must be witty without being funny, and smart without being sarcastic."

With only twenty-one stations in service, the B. B. C. does not deem advisable to follow America's lead and inaugurate a general announcer's course. When a suitable man is found he first spends his time listening to others and watching how they work. It is weeks before he is entrusted with reading a few items of "local news" into the mike.

Just to make his job a trifle more difficult, the B. B. C. expects his announcers also to be shivvers. They must describe the scene so that fans want to hear them.

KFVL Demolished by Fire

SEATTLE—The telephone and Radio schools and Station KFVL, Vancouver, Wash., were destroyed when the building which they occupied was burned down by a fire of undetermined origin. The building was at Vancouver Barracks.

A Revelation in Tone-Volume-Clarity

Here is a "loud speaker" that brings the artists into your very room, so realistic is its reproduction.

Piano music, the most difficult to reproduce, sounds so natural that you are carried away by its beauty.

Vocal selections retain all of the colorings of the artist.

Orchestra music is a treat, every instrument can be heard, clear and full.

Magnetic diaphragm control—used exclusively in the Kellogg Unit—is the new principle that performs these wonders in radio reception.

No excess vibration, no chattering, every tone true.

The Kellogg Unit is available for use with a phonograph, and will reproduce voice or music with a full, sweet, clear tone.

A popular instrument. The Kellogg Symphony Reproducer is a revelation in Tone—Volume—Clarity.

A More Representative Democracy

USE of the Radio by an eastern governor to sound out the people on matters of grave importance pending before the state legislature points out a new and better way for cooperation between voters and their representatives. The idea of appealing to voters to write to their state and national representatives is almost as old as legislatures, but the old method of appeal takes a great deal of time. It requires the enlistment of a large working force, and very often a great many public meetings to arouse public action.

In one meeting, advertised by press and radio, the speaker can reach by radio a great audience and, if his arguments are presented in an orderly and effective way, he is assured of a response. If a sufficient number of letters are received, elected officials are almost certain to be swayed in their action by the sentiment expressed.

For three years the radio audience has been educated in the habit of writing letters of comment on programs and artists. The radio stations have encouraged the habit because these letters are substitutes for the applause which a performer was accustomed to receive. It is quite natural, therefore, for a listener, after hearing an address and a request that he express his views, to write to assemblyman or senator.

A democracy with radio should prove more representative than a democracy without radio. Concurred approval or disapproval of a plan of legislative action may now speedily reach the attention of the elected official. Interest in state and national policies should no longer be limited to the casting of a ballot on election day. Common action, produced by a radio address, should make the citizen feel that this is in fact a government of, for and by the people.

Making Politicians Think

THE Place and the Power of Radio in Politics* is the title of a recent paper by Dr. Frank W. Elliot, of WOC fame and vice-president of the National Association of Broadcasters. The power of radio in politics, we believe, has been very well displayed. Both President Coolidge and Candidate Davis last year found it to their advantage to talk simultaneously from a chain of linked stations to audiences in every section of the country.

However, Dr. Elliot's paper is worth while. In it he has made a very careful analysis of the future of political radio. In it he also says, "Its (radio's) power is to compel the politician to really think before broadcasting."

We hope Dr. Elliot is right. In that case perhaps we have misjudged the average run of politicians. We didn't even dream they ever thought. Except, of course, when it becomes necessary for them to think how they can better themselves to the detriment of someone else, usually the people.

But what can you expect, when the best citizens refuse to use their franchise of citizenship to elect the kind of men who can and will think for the people, once they have been elected to office? Perhaps radio will stimulate the interest in voting so necessary to our common good. That, we should say, would be the biggest thing radio could ever do for this government.

A Billion Dollars for Radio

PREDICTIONS for the fall and winter radio season are hitting high. A large show promoter conservatively estimates that half a billion dollars will be spent for radio sets, parts and accessories during the next year. An official of a large set manufacturer says one billion dollars is closer to the mark.

Quite a growth!

In 1920 the entire radio business of the United States gathered up a bare two million dollars. Last season it is estimated that between three and five hundred million dollars was turned over in sales. Yet, quite a growth for a period of five years.

Beautiful sets, so handsome they overshadow the furniture of the parlors for which they are intended; perfect receivers, as good as science knows yet how to make, await the final buying public.

Yes, we believe at least a half billion dollars will be spent this year. Why not?

RADIO INDI-GEST

Maybe She Swam

"A bit of human static was heard on the air at 4:30 when the static revealed a social gossip passing through that grand old song, 'By the Waters of Minnetonka.' I hope Mrs. Sopranos reads this and recognises her identity." (Elmer Douglass in *Crit. Trib.*)

"By the Waters of the Minnetonka"
Was the song that Elmer tapped
And knowing water taps the ocean
That's the pun that Elmer tapped.

Orders Radio in His Coffin

Sam R. Kirchell, aged San Fernando valley rancher, has placed an order with a Los Angeles upholsterer for a \$1,300 steel coffin equipped with an up-to-date radio receiving set. It was revealed today.—*News Item*

In view of the foregoing, think what might have happened if certain characters of history had taken their tickets to their honored graves. For instance: King Tut, broadcasting to those who would dig him up: "Please go 'way and let me sleep!" Cleopatra, to those who have been handling out the dirt about her affair with Anthony: "I ain't that kind of a girl!"

Oscar Khayyam, in his publisher: "Cut out all reference to 'Bag of Wine' in revised U. S. A. version of *Rubaiyat*."

Marshall: "The world is wrong! I want not unto!" Darwin, after hearing Bryan's Dayton speech broadcast over WGN: "I meant no insult to the monkeys' group. I had no idea that the human race would ever produce a being such as W. J. B."

Webb, Wegner, Maert, and Westbyen, in unison over Fort station hook-up: "There is no Society of Authors, Publishers, and Composers here so we have named the place Heaven."

The Old Stuff Goeth

"A pick-up was made by Station WGY in the night traffic court of Schenectady, N. Y., and cast by land wire to WJZ and broadcast in the metropolitan audience. Three cases were tried for the benefit of the radio fans, the first of which was for Gouraud and Mackay Driving, the second for Driving without a license, and the last for Speeding. These were real honest to goodness cases and when the judge said \$500 fine was imposed on the defendant four of the local radio stations started shouting for the weekly alms."

(From *New York American*)

Say this with your smile:

"I'm late I know my darling wife,
But please let me explain—"

I took my wash and wear my life."

When a bandit held up the train."

"That's all the bank," she said.

"A judge sticks you for your dough."

For having mosquitoes on the head—

I heard it after the radio."

Another said, "I'm so sorry dear.

A friend was sick tonight.

So I had to dinner wear—

and cover him in his plights."

"Get away with that oil stuff.

Don't try to fool me no more.

Boose munter cog raised your blurt

I heard it after the radio."

The old doggy says take him,

All the hell will have to go.

With his tail all on fire

Over the radio.

Miss Partington Returns

From way down in the Tar Heel state comes word that Miss Partington, until some months back a radio feature in this department, is building a new eight roomer and will soon be with us. "Hold your horses the elephants are coming."

I Sure Is Good Says Elmer

By DOROTHY MORGAN

I AM beginning to believe that I am pretty good. I once thought that I was somewhat superior to other human beings, but now I know I am. I am quite sure. Many people say I am pretentious and don't like my stuff, but I know I do and they don't, so who worries?

The reason I am good is that I know that NWG is good. Nobody else would know it unless I told 'em. I write regularly telling people how wonderful I am and NWG are. I am afraid people don't appreciate my kind of writing.

Why, if I didn't criticize broadcasting stations I know my readers would surely turn in some awful station that I don't like and they would. And I realize that I want them to turn in NWG, which is always good music too. Now be careful, my kind readers, and don't tune in anything I say I don't like, because I am sure my heart would break.

Don't Forget the Stamps

Dear Radi: Why, oh, why do you want my contributions? I have sent you these wonderful poems and still I fail to see them in print. If you can't use them send them back so I can submit them to the American Merlinian.

CRYSTAL SET HEIL

Editor, Radi, in this war. These poems were beautiful, but evidently you have never heard the old one about "good sense comes in short doses." Cut them out and send a self addressed and stamped envelope for their return.

Rebroadcasting the Old Ones

Dear Radi: I booked my act to the red pest during the warm weather last week and got "Hot Springs." CAP.

Summer Radios and Some Are Not

VACATIONS of RADIO

Condensed

BY DIELECTRIC

The symphony players again at KDKA, Pittsburgh, were all that one would expect whose receivers had played hot on previous occasions. Despite the absence of any modernism to the music of the Magic Flute, few will deny the beauty of the overture to that opera, and it was this selection which won me to a prolonged hearing of that evening's program. Lucile Winter should be included where praise is being meted out, for her singing of "My Mother Bid Me Bind My Hair," a Hadyn gem, was splendidly interpreted.

I ran across a good—real good—male quartet the other evening. Haven't heard as many since those hot nights have come upon us. Yet that should not pass as explanation. Anyway, those four men did get right into the heart of a medley of old time hits familiar to our grandmothers, and sang heartily, too. They never resorted to an overdose of pathos, yet their voices were soft with feeling where the "darkies" were referred to and the otherwise buckneyed phrases were neatly presented. WSAI, Cincinnati, was responsible for our hearing such a program and we should thank them.

Another of the operatic programs from the studio of WEAF, New York, presented "Martha" (incidentally this is most closely associated in my mind with the great prima donna, Melba). These performances have gone a long way to acquaint many people with the beautiful melodies to be found in grand operas and to familiarize the minds of some as to the real character of each musical production. Mr. Benedicto has seldom failed to impress me with the seriousness of his art and the singing of Laurel was no exception.

Elgin, Ill., with its WTAS broadcasting station, has something to boast of, even if others outside the immediate vicinity find cause for complaint at times. They were well supplied with excellent material where the evening's entertainment consisted of a group of soloists and an orchestra. Diversity may not guarantee enjoyment, yet it is likely to meet the wishes of a large number of listeners in, and that was precisely what WTAS gave.

It is very improbable that any old time-listener would skip over the dial setting for WSB on the dedication date of the wonderful new transmitter at the Atlanta Biltmore hotel. To me it seems as though the "Voice of the South" is synonymous with Radio broadcasting. Each step this dear old southern station has taken, found Dielectric always on hand to rejoice with the owners of one of the most friendly and interesting stations in the land. Three years' reminiscence was crowded into that one program and few of the genuine B.C.L.'s tried out without winning them all the success in the world. Lambkin Kay is a name thousands do not recognize, though that genial gentleman's voice could not be imitated far.

Symphony orchestras are no longer the delight of those only who pack concert hall-think fortunes—but are enjoyed and are the instructors of thousands of Radio listeners today. Comparisons are not in order here and I have no desire to make any, but to any music lover missing the concert given by the Detroit symphony orchestra recently, I have only sympathy. It was a banner evening in the history of classical music broadcasting and if such a program is again presented be sure to get there early. WCX be thanked.

A. B. C. Course in Radio Fundamentals

Chapter XX—Characteristics of Two and Three Electrode Tubes

By David Penn Moreton

LET us first consider what happens in a two electrode vacuum tube, in which there is a good vacuum, when there is, first, a variation in the temperature of the filament and, secondly, a variation in the voltage of the battery connected between the plate and the filament. The connections of the tube for this investigation are shown in figure 83.

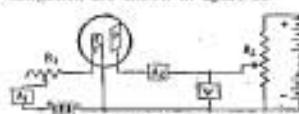

Figure 83

The current through the filament may be varied in value by means of the resistor R_1 , and the value of this current is indicated by the ammeter A_1 . The voltage applied between the plate and the filament may be varied in value by moving the sliding contact C along the resistance R_3 , the value of the voltage being indicated by the voltmeter V , and the value of the current in this circuit by the milliammeter A_2 .

Space Charge.
Suppose now, that the voltage between the plate and the filament is kept at some constant value, and the filament temperature is gradually raised by increasing the filament current. The number of electrons sent out by the filament will continue to increase as the temperature of the filament rises, and there will be a stream of electrons passing from the filament to the plate. Due to this stream of electrons passing from the filament to the plate, there are, at any instant, a number of electrons in the space between the filament and the plate.

This group or cloud of electrons, between the plate and the filament, produce a negative space charge. The effect of this negative space charge upon the electrons leaving the filament is opposite to that of the positive plate potential. As the temperature of the filament is increased, there will be an increase in the electrons between the plate and filament and, hence, an increase in the value of the space charge, until finally the space charge neutralizes the plate potential and there is no further increase in the plate current due to an increase in filament temperature. The tendency of the filament to emit more electrons per second due to the increased temperature, is offset by the space charge effect, which retards the electrons back into the filament so that the net number emitted remains constant.

If the voltage between the plate and the filament is increased, there will be an increase in the current as indicated by the milliammeter A_2 in figure 83. With the higher voltage connected to the plate, a larger space charge will be required to offset the effect of the plate potential.

The variation in plate current with filament temperature is shown graphically in figure 84, for three different voltages.

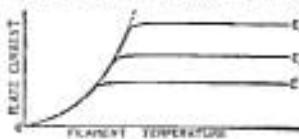

Figure 84

between the filament and the plate. Let us now assume that the filament temperature is kept constant and the voltage between the plate and the filament is varied. There will be a definite number of electrons emitted by the filament each second. The magnitude of the plate current will depend upon the number of electrons reaching the plate per second, which in turn depends upon the potential of the plate. The current increasing in value as the voltage between the plate and the filament increases in value. As this voltage is increased, a value is finally reached at which all the electrons emitted by the filament arrive at the plate. When this value of plate voltage is reached, the plate current is a maximum and this value of the current is called the saturation

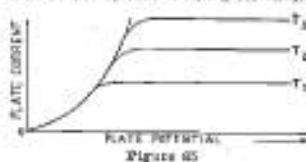

Figure 85

value for that particular filament temperature.

The variation in plate current with plate potential is shown by curve T_1 in figure 85. This curve shows that when the plate potential is low, there is no plate current and, as the plate potential is increased, there is at first a very small increase in plate current, but as the plate potential continues to increase, the plate current increases more rapidly than the plate potential up to a certain point, when the plate current has reached the saturation value as explained above.

If the temperature of the filament is raised to a higher constant value by increasing the current through R_1 and the

plate potential varied in steps from zero upwards, the plate current will increase with the plate potential along the same line as it did for the lower filament temperature until the saturation point is reached and the filament current will rise higher in value than it did before as shown by the curve marked T_2 . A further increase in filament temperature will give the curve marked T_3 .

Three Electrode Vacuum Tube

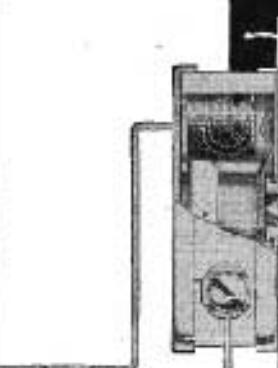

The three electrode vacuum tube differs from the two electrode tube described in the last chapter, in the addition of a third electrode G , as shown in figure 86, between the plate and the filament and in the path of the electrons. This electrode

may be a perforated plate or mask or grid of fine wires, through the openings of which the electrons must pass in their travel from the filament to the plate. It is possible to accelerate or decelerate the electrons moving from the filament to the plate, and to condense or increase at will the effect of the space charge, by applying a positive or negative potential to this third electrode or grid. This third electrode provides a means of controlling the current in the plate circuit, without changing the plate potential or filament temperature. The chief advantage of this method of controlling the plate current is that, while the plate current may be

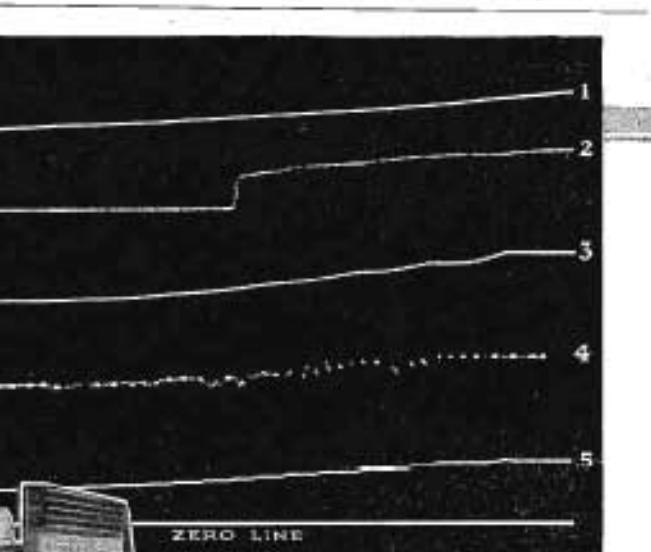

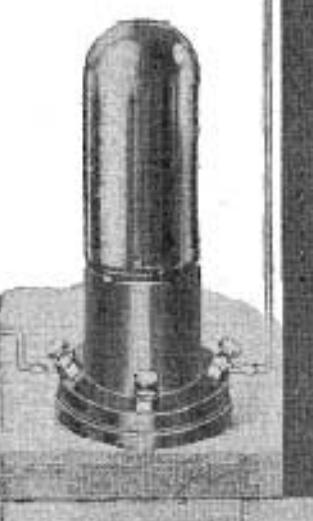

(Continued on page 197)

Bradleystat

PERFECT FILAMENT CONTROL
The result of more than twenty years' research and experience in the manufacture of graphite disc rheostats for radio, mfgs., mills, etc.

Use the same Bradleystat for ALL Radio Tubes with out changing connections.

Only Graphite Discs provide noiseless filament control

A spot of light, silently guided by an automatic electric oscillograph, traced the above curves on a moving photographic film. The test, made at the University of Wisconsin, was impersonal and impartial. The result, however, proves beyond a doubt the superiority of the Bradleystat for radio filament control.

The first line (No. 1) shows the silent, stepless variation produced by the Bradleystat. The following curves (Nos. 2, 3, 4, and 5) were produced by other types of rheostats, some using loose powder instead of graphite discs. See the scratchy, noisy control. Every jog in the white lines means a distracting noise in the loud-speaker.

Is it any wonder that Bradleystats are being substituted for ordinary rheostats by thousands of set owners? Try one, yourself, and hear the difference!

Radio Inductive Interference and Its Cure

Part II—Means of Suppression

By Radio Branch, Dept. Marine and Fisheries, Canada

IN MAKING all these tests it is important to approach the subject with an unprejudiced mind as to the source of the interference, and before concluding that the interference is caused by any given source, it is well to consider all possible conditions in which the interference may have originated from some other unknown cause. Investigating interference is a very fascinating pastime game and one would naturally suppose that the source of the interference had a sense of humor and was trying to make detection in a master similar to that of the most clever criminal.

The obvious and only satisfactory method of suppressing radio interference

is to remove the source of the interference. The turns are carefully removed from the hole in the tube so as not to cut the insulation. End rings or filters are mounted at the end of the winding to build up the same diameter as the outside diameter of the winding. These may be made of jaws or a suitable size of wire tube. The windings are covered with two layers of Enamelled cloth and then taped with black friction tape and painted with insulating varnish. Mounting legs made of bone are then attached to each end of the coil.

This coil should be mounted on a board covered with asbestos 1/8 inch thick and the leads soldered and thereafter taped according to standard wiring practice.

a choke coil and thus prevent the necessity of adding additional choke coils to the system.

Motor Brushes Interference

A series commutator motor, having a single or split ring at the brushes, may have its leads reversed to reduce the radio interference. Where one wire is grounded, radio interference from such a motor is substantially reduced by reversing the leads supporting the motor, as one of the brushes is connected to the ground side of the line and the field coil is connected to the live side of the line. In this case, the field coil is used as a shield. It may also be necessary to place a condenser of one or two microfarads

voltage lighting circuit may be determined by means of a test lamp connected from ground, first to one wire and then to the other. The lamp will light when connected from the live line in ground.

Battery Chargers and Sign Flashers

A battery charger of the vibrator type may be prevented from causing interference by connecting a condenser of 1 microfarad capacity across the vibrator contacts. In the case of battery chargers it is useless to put condensers across the leads, as it is necessary to make use of the choke consisting of the wire and coil within the battery charger to prevent those surges from getting out on the line. Flashing electric signs may usually be

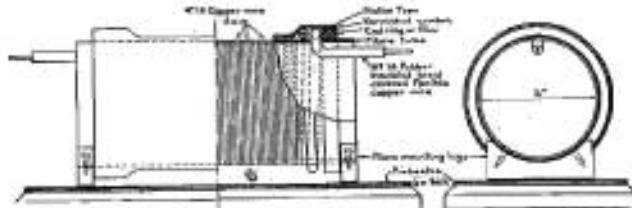

Figure 1

interference which is caused by electrical apparatus which is defective in its potentiometer, in good condition. The owners of such electrical apparatus are always very pleased to have their attention drawn to the fact that their apparatus is in need of repair. It having been found many times that this radio interference is the first indication of a fault, which if not attended to, may cause serious damage.

In cases where the electrical apparatus appears to be in good mechanical and electrical condition it is very often possible to employ some means of preventing electrical surges originating in the apparatus from getting out in the power line over the would radiate and cause interference.

Condenser Prevents Surges Traveling
Power electrical surges have the property of passing through condensers more readily than through inductances. The method employed therefore, in preventing electrical surges from traveling along the power lines and thus causing radio interference, is to provide a path to ground in the form of a condenser in line or ahead of this surge. In order to make this filter more effective it is often advisable to introduce between the line and the source of the disturbance a trap which will make the passage of the surge more difficult. This trap preferably takes the form of a choke coil which consists of a number of turns of wire of sufficient

Mounting Condensers

Condensers which will stand a test voltage of 1,000 volts direct current may be connected across an alternating current or direct current circuit of 220 volts or less. On circuits which are protected by fuses of not more than 10 amperes capacity, no additional fuse is required for the condenser. On circuits protected by fuses of greater than 10 amperes capacity, a separate circuit base and switch for fuses of greater than 10 amperes, must be installed between the condenser and such ungrounded power wire. Where condensers are not installed in metal boxes and are to be placed on wooden surfaces, they should be mounted on pads of asbestos at least 1/8 inch thick, and these pads should be sufficiently large to extend beyond the edges used for holding the condenser in place.

Where condensers are to be used in two-wire circuits two condensers of the approved type must be connected in series between the lines, and the common point may be grounded. In such installations the condensers are to be protected by 400-volt fuses not greater than 10 amperes in each line, and both the condensers and fuses are to be enclosed in a grounded metal case. Where the condensers are to be connected to three-phase or three-phase circuits not greater than 600 volts, one condenser may be connected from each live line to ground and installed with fuses as stated above.

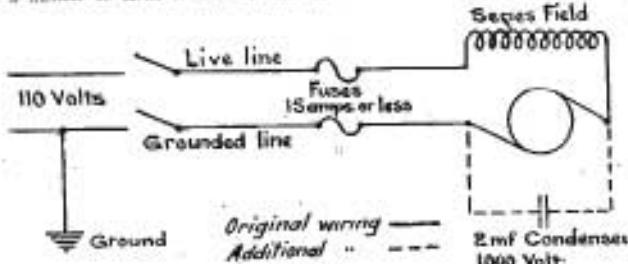

Figure 2

size as to carry the required current without overheating, and sufficient insulation to withstand the voltage of the lines. These installations should be approved by the local electrical inspector to ensure that there are no fire or accident hazards introduced by the installation.

It is important in the design of these choke coils that they should have low distributed capacity in order to prevent electrostatic surges passing through the choke coil by means of this capacity.

Choke Coil Construction

A type of choke coil recommended for cases where the current in less than three amperes is constructed according to Figure 1. It consists of 100 turns of number 18 double action enameled copper wire in a single layer wound on a tube 1/2 inches in diameter, 1/8 inch thick. Leads are soldered to each end and made from number 14 flexible rubber insulated braid-covered copper wire, taking the wire around the tube then through the inside of the tube a length of one foot.

As these condensers contain iron, they should not be placed where they may be subjected to excessive heat. Condensers when connected in a circuit as stated above have no objectionable effect on the circuit or the operation of any electrical apparatus and they do not consume any power.

Approved Condensers

Condensers similar to Northern Electric company type B-21-A.A. 1, 114A, 1,000 volts direct current, are suitable for installing in metal boxes as described above. Special condensers having number 14 rubber insulated leads, suitable for installing without metal boxes, may be obtained at cost from the Radio Branch, Department of Marine and Fisheries, Ottawa, and will work fine as non-consumable fuse stock items. (This probably only applies to Canadian fuses.—Editor's Note.)

In many cases it is possible to make slight changes in the connections of the electrical apparatus causing the surge in order to use some existing apparatus as

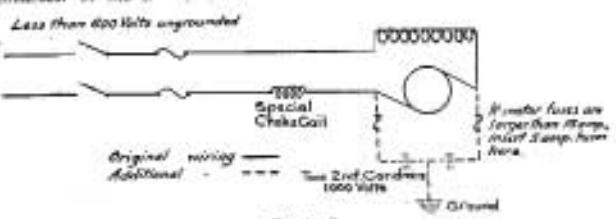

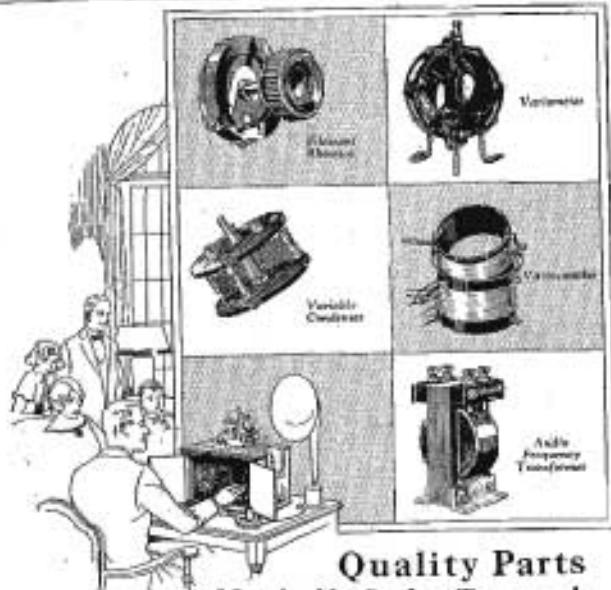

Figure 3

capacitor across the brushes. See Figure 1. In cases where neither side of the line is grounded, a choke may be inserted on the side connected directly to one of the brushes, while the field coil may set as a choke in the other line. In this case it is recommended to use two 2-microfarad condensers in series and ground the middle point according to the diagram, Figure 2.

In cases where it is not convenient to make connections with the brushes of a motor, the condenser may be placed across the line as near the motor as possible, and a choke coil may be inserted in the live line when necessary. Instructions for the installation of these units were given above. The live side of a line

is prevented from causing interference by connecting condensers from 1/2 to 2 microfarads capacity across the contacts of the circuit breaker. As the radio interference from such sources depends upon the conditions of the installation, it is necessary to make these few experiments as suggested above, in each case, in order to reduce the interference most effectively.

Sometimes the interference from a flashing neon installation is caused by working at the commutator of the motor which drives the flasher. This difficulty may be determined by the nature of the sound in the radio receiver and may be remedied by the method described for (Continued on page 30)

Quality Parts Matched for Perfect Teamwork

Your "pet" book-up needs fine quality parts—perfectly matched—in give you real radio.

Interesting Work With Oscillating Crystals

Zincite (ZnO) Used By Russian Engineer

By Frederic M. Delano

THE term "oscillating crystal" has been a standard joke among the radio fraternity for a number of years since it was presumed that the usual crystal rectifiers, as used in reception, were incapable of oscillation and could pass radio frequency current in but one direction. Yet, strange to say, this seeming impossibility has now become not only a possibility, but a workable reality.

The oscillating crystal was first developed by a Russian, M. Lassau, and it has been attracting considerable attention in Europe this past few months, with some comment in the press of America. Many and remarkable are the tests, hook-ups and results gained by the Radio amateurs in the Continent and the British Isles. Among the most important perhaps, from the standpoint of practicability, and utility for the average amateur, are those worked out and actually tested with success by one of M. Lassau's friends, M. Vinogradov, a Radio engineer formerly with a Belgian Radio company and now doing some special Radio work for one of the largest technical magazines in Europe.

Designs Lassau's Circuit

The basic hook-up from which these were worked out, by the way, is not the original of Vinogradov, but he has taken the original idea of Lassau and worked out refinements and helps that formed, ultimately, the circuit shown herewith. Vinogradov says that while there is a wide difference of opinion in Europe, the one group of scientists claiming the oscillating crystal useless, the other group that it will soon replace the vacuum tube, he personally is reporting only what he has done himself.

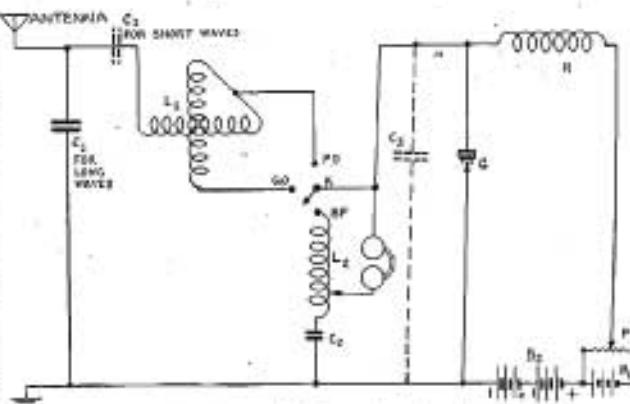

The diagram gives an idea of a receiver made with the Zincite crystal, and, as shown without dotted lines, allows for the reception of the longer wave lengths from 2,000 to 12,000 meters. The batteries, B-1 and B-2 are ordinary dry batteries such as are used in America as C units; B-1 providing 6½ volts at the terminals and B-2 giving 9 volts since two C units are placed in series. Potentiometer P has a resistance of about 400 ohms (standard on the American market) and may be made of 3 meters—about 28 feet 8 inches—of nichrome wire, .1 mm. in thickness.

The unit R is about 399 ohms and should have as large an inductance as possible, a very low distributed capacity and be wound in sections on a multi-layered coil. Fill the first narrow slot then pass to the next and then to the third, much as when winding an untuned radio frequency transformer. It is a good idea to wind with enameled or silk insulated copper wire of about 1 mm. thickness (No. 33 E. & S.) of which about 1,500 feet will be necessary.

The Tuning Circuits

Coil L-2 should have an inductance of about 0.02 henry, and can be wound on a wooden spool from #8 mm. (3/8 inches) wire by 36 mm. (1½ inches) in diameter. Per turn, some 875 feet of insulated copper wire will be needed, 1 mm. to 4 mm. in diameter (No. 34 E. & S. to No. 38 E. & S.). Two ammeter coils, one of 25 turns and one of 100 turns, can be used. If the inductances so wound for the experimenter, he must be careful to arrange for a tap at the 50th turn for the connection to the band receiver.

The condenser C-2 should be of 0.02 mfd. capacity. These also are for sale in the United States, but if the experimenter

Many an interesting noise can be had experimenting with this hook-up.

wishes to make this unit himself, he must on the position EP while the steel point of the entwister is placed on the rod part of the crystal; at the same time move the potentiometer P slowly. In the head receivers will be heard the usual whistling or low frequency oscillations produced in the circuit C-2 and L-2. Search the crystal for a more sensitive point if the first tried fails to produce this whistling, and when this spot is found place the switch K in the position EO or GD according to whether the upper or lower wave length range possible is required; EO for short waves, GD for longer ones. Turn the varistor L-1 to bring in the station desired.

At this instant, the continued oscillations are turned on by the circuit L-2 and C-1 and the set is operating like the ordinary ordinary European lamp. Contin-

uous wave stations are now heard in whistling noise, damped waves on a sort of flowing note. By means of the potentiometer P, the maximum intensity can be found in just the same manner as occurs with regeneration in ordinary tubes.

No effort has been made to describe the construction of a complete set of there is no precedent on which to determine the amount of interest in this subject among American broadcast listeners. If the response indicates sufficient interest among Radio Digest readers, the technical department will be glad to secure more articles and do more research work with the little available.—Editor's Note.)

A. B. C. RADIO COURSE

(Continued from page 17)

unit, and the energy transferred in the space circuit quite considerable, yet the energy required to charge the grid to the desired potential is extremely small on account of the small capacity between the grid and the filament.

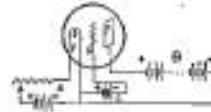

Figure 86

The operation of the three-electrode vacuum tube may be explained as follows: The tube will operate like a two-electrode tube provided there is no potential difference established between the grid and the filament. Now if the grid is given a negative potential with respect to the filament, for example by connecting a battery, G, with its plus terminal to the filament and its negative terminal to the grid, as shown in Figure 86, the space charge effect of the tube will be

MAGNATRONS

A GLASS, a base and some hunks of wire—Kipling would have said about vacuum tubes. And so they are. But what a difference the method of assembly and manufacture makes!

MAGNATRONS are built with the precision of a fine watch, and tested just as carefully before they leave the factory. You can always count on MAGNATRONS to get the most and the best out of your set.

Your dealer sells Magnatrons in the types 222-A, 100, and 100 Large Base.

CONNENET ELECTRIC LABORATORIES
Magnatron Building Hoboken, N. J.

Back of panel view of the department's trouble-shooting receiver.

INDUCTIVE TROUBLES(Continued from page 18)
Dealing with interference from commutator motors.

Internal combustion engine ignition systems may cause Radio interferences, but this is usually of a very local nature. This, however, may be considerably reduced by making the leads from the magneto or spark coil to the engine as short as possible and running them in a grounded shield such as metal conduit or lead covered cable. The frames of the engine, magneto, and all shields, should be thoroughly grounded.

Rotary converters sometimes cause Radio inductive interferences by producing

for bleaching purposes in flour mills sometimes cause Radio inductive interferences by producing a surge which travels along primary lines supplying the millstone. This interference may easily be eliminated by connecting two spark coils of the cylindrical type previously described one in each of the low voltage lines placed as near as possible to the millstone.

Portable Detection Receiver

Two illustrations are reproduced with this article showing the set used by the Department for locating Radio inductive interferences. This set was also readily disassembled in the rear of the truck shown with the first article. The diagram used for connecting the various units is given here as figure 4 and the reader living in the United States will probably at once be struck with the fact that tube elements are connected in series while most of the American circuits use the Marconi parallel. This is due to the fact that Northern Electric tubes of the "pan-

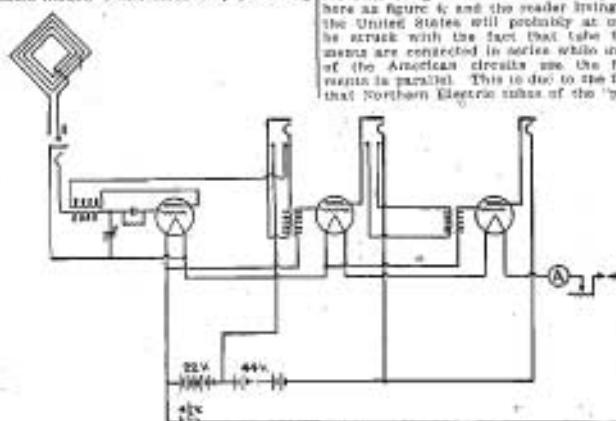

Figure 4

A surge which travels out both on the alternating and direct current lines. In some such cases it may be necessary to introduce choke coils into the alternating current lines and put condensers across the lines between the choke coils and the converter. Before putting these choke coils in the alternating current lines, it is recommended to try the effect of condensers across the brushes as described previously for the case of commutator motors.

Electric operators which are used for purifying the air in large buildings and

"cut" type were used, which require a filament voltage of but 1.5. The power source usually consists of a 1.5-volt dry cell so it is logical to light three of these tubes in series from a 4.5-volt battery. The reader can readily change the filament connections to suit the tubes used, however.

The specifications for this set are as follows: The loop is to be pancake wound, outside turn 22 inches square and consisting of 14 turns, spaced $\frac{1}{4}$ inch. Plate coil consists of 50 turns of number 18 dia. (Continued on page 22)

Element meter is not essential to success if ammeter is prohibitive.

The *new* Radio Book

How to understand radio, assemble circuits, improve reception, operate sets,

EVERY phase of Radio reception gathered into one book at last! Explanation of elementary principles, directions for constructing parts, detailed how-to-build articles for the assembly of sets, operating directions on popular manufactured outfits.

Haven't you often wondered what all the spirals, wriggly lines and zig-zag lines were about on diagrams? A big chart shows you a picture of the part as you see it and, beside the picture, the symbol used in diagrams. Other articles show clearly just what happens within the mysterious little vacuum tubes that glow hour after hour within your set, apparently without change, yet pass every note of a jazz orchestra or soprano.

Antennas, for whose erection there are seemingly no rules, are covered fully; the reason for a long wire in some locations and a short one in others, is readily grasped by anyone. Crystal sets, one tubes, two tube reflexes, three tube regenerative and reflex outfits, four tube R. F. and neutrodynes, five tube assemblies—all types are presented up to the nine tube "super," king of the air.

For the Man That Bought His Set

For the non-technically inclined there is a two-color broadcast map of the country, operating schedules of all the leading stations, call letters and power rating of every station on the air, suggestions for the care of batteries and tubes.

No matter what type of receiver you own, there are dozens of valuable suggestions on tuning, trouble shooting and operating. Your head receivers, loud speaker, antenna and certain parts within the set, require frequent cleaning, adjusting and care. Interference and its remedies are factors you should understand even though you care nothing about "what makes it go."

Compiled by the technical staff of Radio Digest, it represents the high lights of the past twelve months in the Radio field. All this data is indexed for ready reference and logically arranged. Pipe Fittings Make Antenna Masts

Strong Aerial Supports Not Hard to Construct

A simple and neat pair of antenna masts can be made by anyone if the following directions are followed.

Use 2-inch iron pipe and fittings. Decide how high above the ridge you want

WORKSHOP KINKS EARN A DOLLAR

There are many little kinks worked out at home that would aid your fellow Radio worker if only he knew about them. There are new hook-ups, new ways of making parts and various unique ways of operating sets that are discovered every day. Radio Digest is very much interested in obtaining such material. Send them in with full details, including stamped envelope, no rejected copy may be returned. The work must be entirely original, not copied.

RADIO KINKS DEPARTMENT

Radio Digest

105 North Dearborn St., Chicago

the aerial and add one-half the height to allow the pipes to fasten to the building. Thus if it is decided that the aerial should be 5 feet above ridge, the pipe would be cut 7½ feet long.

Through one end of each pipe, insert the other end, drive a wooden plug and secure it with large screw eyes. Secure an elbow on the other end.

Measure the distance from the corners projects from the side of the building and set a short step or staple, screw this into the elbow and on the other end screw a flange. With a string fastened near the peak and the flange screwed to the side of the building, these aerial supports are held firmly, and the expense of this new construction is small.—H. A. Thompson, Utica, N. Y.

increased. That is, the negative charge of the grid will repel the electrons emitted

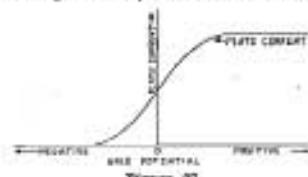

Figure 27

by the filament back toward the filament, which will result in a decrease in value

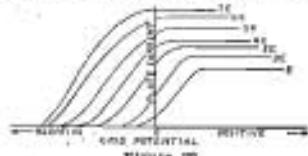

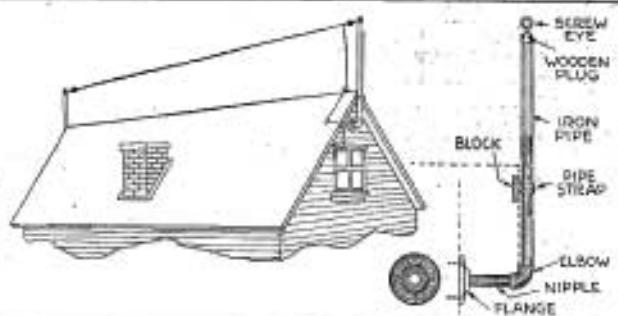

Figure 28

as the negative potential of the grid with respect to the filament is increased and

DETAILS FOR ASSEMBLY OF MASTS

Finally the grid may be made sufficiently negative to entirely stop the flow of electrons from the filament to the plate.

If the grid is charged positively, the negative space charge within the tube will be partly neutralized and the plate current as a result will be increased, raising the filament temperature and the voltage across the plate and the filament to be constant. That is, the

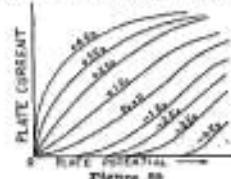

Figure 29

positive grid causes the plate to attract the electrons emitted by the filament. The plate current will increase as values of the positive potential of the grid with respect to the filament is increased until the saturation current corresponding to the existing filament temperature is reached.

Characteristic Curves

The variation in the plate current of a tube, due to a variation in the potential of the grid for a fixed filament current and plate voltage, is shown in figure 27. A curve of this kind is called a static characteristic curve of the tube, and there is such a characteristic curve for every combination of filament temperature and plate potential. For example, assuming the filament temperature is constant, then a number of curves such as the ones shown in figure 28, may be obtained for various plate potentials. The higher the plate potential, the more the curve is shifted to the left.

Another way of showing graphically, the relation between the plate current and the plate potential for various grid potentials is by means of a family of curves similar to those given in figure 28.

Whenever the grid is made positive, a few of the electrons emitted by the filament will pass to the grid rather than the plate which will result in a current in the grid circuit. Under the usual operating conditions this grid current is very small in comparison to the plate current, and it decreases in value as the potential of the grid is increased.

Amplification Factor

The voltage amplification factor of a two-electrode vacuum tube is defined as being the ratio of the voltage between the plate and grid potential variation which will produce the same variation in plate current, the temperature of the filament being constant. For example, if a certain change in grid potential produces a certain change in plate current, and the plate potential must be changed in value eight times as much as the grid potential was changed to produce the same change in plate current, then the voltage amplification factor of the tube is eight.

The voltage amplification factor depends upon the construction of the tube, as explained in the following paragraph. Assuming the grid of a tube is connected to the negative terminal of the filament which will be considered the reference point for the various potentials, then the potential of the grid to zero. The electrons emitted by the filament, under the above conditions, are attracted to the plate by that part of the electrostatic field of the plate which is not screened by the grid, due to the arrangement and spacing of the grid wires. This is called "bias

field" of the plate in dependent upon the positions and shapes of the electrodes in the tube, and varies directly as the plate potential. The amplification factor of a tube varies inversely as the spacing between the grid wires, because the stray field due to the plate will be smaller as the mesh of the grid is decreased.

The amplification factor also varies directly as the ratio of the distance between the plate and filament and the distance between the grid and filament. The closer the grid is placed to the filament, the smaller the grid potential required to set up a field around the filament equivalent to the stray field of the plate. In general, in order that the tube may have a large amplification factor a fine mesh grid should be used, the grid should surround the filament as completely as possible, and the distance between the grid and filament should be small in comparison to the distance between the plate and filament. The amplification factor for a tube is not constant but varies somewhat with the grid and plate potentials.

(Next week Professor Maxson will explain such terms as plate impediment, plate circuit resistance and mutual conductance, and point out how they are important in tube operation.—Editor's Note.)

Dial Marker from Switch Point

A very good dial marker can be made from an old switch point by filing the head of it to a triangular shape. If the

SWITCH CONTACT

point is too long and interfere with the condenser plates it can easily be filed down until it just goes through the panel for enough to allow a nut to be put on.—Malph Crosby, Sand Springs, Okla.

Don't expect sharp or poorly insulated connections to give good results.

Questions and Answers

Selectivity vs. Range
(14132) D.E.L., Big Horn, Mont.

I do not have a fine tube Radio set. I do not have very good leads in being able to separate one station from another in a range of 4 degrees. Stations KGO, KOMO, WLS, and WDAB are all strong stations and when there are all on the air about the same time, unless the air is very clear, will give me quite a good deal of trouble to separate.

I use an antenna of T-spiral plain No. 22 gauge phosphor bronze wire 100 feet long, stretched taut at a height of 20 to 22 feet high and a lead-in wire of 20 feet, insulated. I have it stretched in a northeast direction from the set. Does it make any difference as to the direction the antenna is stretched from the receiving set? Would I have better results if I used another kind of antenna? I do not have any of the described type radios to trouble me as I live 10 miles from the nearest electrical application. How can you tell whether the ground wire is well grounded or not with this set? If you have a battery voltmeter to test B batteries how can I tell when they are about run down? Is there any disadvantages in using four 22-volt B batteries rather than two 45-volt B batteries?

Are any of the static eliminators advertised in the Radio Digest of big enough success to pay me to add one to my set? If so, which one would you recommend? I am buying one and can give you some information I may add to my set to help eliminate some of this summer static. All the Radio Digest does not receive compensation for answering questions, will make up for it by trying to get circulation enlarged among my neighbors this coming fall and winter.

A.—Relative to your difficulty with selectivity, or the lack of it, we wish to advise that on this receiver, or any other of similar types, you cannot have a good to total range or a Chicago to San Francisco range in summer and still have selectivity. Part of the transoceanic range which you have is the result of your use of a 100-ft. antenna wire and in the writer's opinion it will be impossible to have good selectivity with such a comparatively long aerial. If you will cut down the length of the straightaway wire to about 80 feet, which will give you an over-all length of 90 feet, including lead-in, the selectivity should be considerably helped. There is no way of testing for a good ground other than putting in the very best that you can with well soldered connections or putting in three or four different points such as the cold water system, the radiator and anything else you can think of, and use them all at once. There is no way of testing B batteries without the use of a meter. There is no difference in efficiency between the use of four 22-volt B batteries as against two 45-volt B batteries.

Although the static eliminators advertised in Radio Digest will work in some locations and eliminate about 35 to 40 percent of the static, none of them will work in all locations as will they eliminate more than about 40 per cent of the static without a noticeable decrease in volume. The writer neglected to mention above that shortening the aerial from 100 to 80 feet will slightly decrease the volume and may make reception of a few very distant stations impossible in sum-

ATTENTION please. Is it worth \$6.00 and an hour's work for you to rewire your receiver? If so, we will bring you complete data of a device that you should not be without. St. Paul Radio Improvement Co., P. O. Box 3193-M, St. Paul, Minn.

mer times but the selectivity on those that are not will bear with lead speaker volume will be much improved and next fall, and winter you will again be able to have a coast-to-coast range.

Ground and Aerial with Super-het—(14134) C.M., Evansville, Ind.

In your May 1, 12, 17 and 24, 1924 issues of the Radio Digest you described an eight tube super-heterodyne receiver made to work on a loop and I want to know how I can adapt this receiver to work on a regular outside aerial and ground. Also in your June 27, 1924 issue you described an eight tube super-heterodyne receiver made to work on a loop and I want to know how I can adapt this receiver to work on a regular outside aerial and ground.

A.—We wish to advise that any super-heterodyne designed to work on a loop aerial can be used with an outside antenna by connecting the two terminals intended for the loop leads to the secondary terminals of an antenna coupler. Such a coupler should have about 40 turns on a 3-inch tube or 80 turns on a 2½-inch tube as a secondary while the primary should have from 8 to 16 turns. The coupling between primary and secondary should preferably be very loose and the primary should be at 90°. In case the super-heterodyne is designed for a center tap loop, the center point of the secondary coil should be determined and the three terminals from the receiver connected to the two ends and the center point exactly as though it were a loop aerial. See diagram and write back for further information. We refer you to our issue of March 7 in which we started a series on the Four-Plier Super-heterodyne and the first article showed the connections whereby the tuner may be connected to a loop or antenna in two jacks of connection to an antenna coupler antenna by widening the loop jaws.

To Catch Lower Waves
(14100) F.R., Scarsdale, Ill.

I have a home-made heterodyne which works fairly good except that I cannot get stations much below 225 meters. KWW comes in at about 24 on my dial. I am using Cardwell 17-grid condensers and homemade semiconductors having 8 turns of primary wound on 3½-inch tube (outside measure) and spaced about ½-inch apart, 88 turns of secondary with a tap at the fifteenth turn and wound on 1-inch tubing (outside measure). I used 22-gauge solid covered wire. I would like to know what changes should be made in the construction so that I could get down to about 200 meters.

A.—First of all time in KWW, which you say comes in at about 24. Then disconnect the secondary of your second neutralizer from the grid of the second and take off about five turns. Do not touch the settings of the various condensers while doing this. Then con-

nect the coils Aligned a new way in few minutes. Check with full instructions from Mr. Neale, through Sales, Box 812, Fort Wayne, Ind.

Radio Tubes Exchanged
Send us your old radio tubes and we will exchange them for new ones. Exchange rates are as follows:
WD-11, \$1.75

nect the secondary to the grid and turn the second dial until KWW is again heard. Continue this process, leaving the first and third dials at their settings until KWW comes in at about 22 on your second dial. Do the same with the other two neutralizers and you will find that with KWW at 22 you can go much farther down on the wave length range and probably can hear stations at 220 meters. The set will have to be personalized, however, to allow for these changes.

Using Wrong Tubes

(14105) P.C.H., Erie, Pa.

I have a Brantton Super-het, all the parts, and it is a nice looking outfit in the window and everything. I have built it as specified in the booklet that I got with the parts. The set has sheet radio frequency, two stages of intermediate radio frequency, and two stages of audio frequency. The whistles and barks in the set caused by oscillation are something awful. It is the same with the loop as well. In order to bring in a station I must turn the rheostat on full and the whistles and noise rule all reception. I have been using condensers in all places in the set but the whistles and barks are the same. The grid voltage I have been using is 3 to 5 volts; for plate voltage, 90 to 135 volts, and for detector voltage, 60 to 90. Grid leak has been tried in all capacitors. It is a Brantton reflexed super-het using 301A tubes. El. No. H-193, cabinet size 16x14x9 inches.

A.—We wish to advise that the probable cause of your trouble is that you are using the Brantton H-193 designed for 120 tubes with tubes of the 301A class. The reflexed super-heterodyne will all work well with 120 tubes but they do not work well with the 301A tubes. You might write to the manufacturer of this kit and see what they say suggest.

Underground Aerial Grid Static

(14063) L.P.W., Coffey Springs, Kan.

Which gives more volume, UV-193

tubes or UV-211? Has there been any kind of instrument devised which will reduce static a little at least?

A.—We wish to advise first of all that the 211A tubes will give more volume than the UV-193. The energy that will be delivered by a tube may be measured by the amount of dissipated energy consumed and this may be figured by multiplying the volts times the amperes. Since 3 times .25 is greater than 3 times .16, the 211A gives the greater volume. There has been no device or instrument de-

vised that will reduce static dependable and under all conditions. An underground antenna, such as was recently described by Mr. E. T. Jones in Radio Digest, will work to the majority of cases and will reduce about 50 per cent of the static.

INDUCTIVE TROUBLES

(Continued from page 20)

wire wound on a 3½-inch tube. The coil is composed of 40 turns of number 26 wire wound on a 2-inch tube. Tuning condenser is of .0000 mfd. maximum capacity and variable. For the tubes used, the rheostat has a resistance of 10 ohms, and the ammeter a range of 4 to 8 amperes. Grid condenser is fixed with a capacity of .0001 mfd. while the grid leak has a resistance of 3 megohms.

A.—We wish to advise that the probable cause of your trouble is that you are using the Brantton H-193 designed for 120 tubes with tubes of the 301A class. The reflexed super-heterodyne will all work well with 120 tubes but they do not work well with the 301A tubes. You might write to the manufacturer of this kit and see what they say suggest.

It will be noted that Jack number 3 is not wired in the usual way to prevent of reception on the detector alone but is connected in such a manner as to provide double amplification when it is desired to use auxiliary apparatus in connection with current variations audio frequency sets.

Volumes 8, 9, 10, 11 and 12

Full of valuable information for every set owner. Antennas of various types have been described, the care of batteries is gone into thoroughly, there are pages and pages of tuning hints. Hook-ups that give the experimenter many hours of pleasure and experience, complete how-to-make articles on various types of sets. A score of illustrated articles on the country's most popular stations and the artists they secure.

A year's subscription to Radio Digest at \$5.00 brings you 52 issues with all the live news of Radio—broadcasting, invention, construction, programs, illustrations. With the first issue you receive your choice of these five bound volumes—either 8, 9, 10, 11 or 12. This offer good only on subscriptions sent direct to this office, not through agents or agencies.

Prest-O-Lite

There are many improvements in the new Prest-O-Lite Battery

In this new battery you'll find all the good points and high quality that have made Prest-O-Lite an unfailing aid to better radio. And in addition there are many important refinements and improvements that make it the most attractive, most convenient battery you can buy.

This new battery has a beautiful stippled finish hard rubber case that blends with any furnishings. The case is molded in one piece, giving sturdy, leak-proof strength.

To make the battery convenient to carry, the handle has been given a comfortable rubber grip.

The oversize terminal nuts on the binding posts are easy to turn and insure perfect contacts.

Novel rubber insulators completely cover the tops and

sides of the cell connectors, preserving the original fine finished appearance at all times and giving protection against accidental short circuits.

No effort has been spared to make this a battery you will be proud to own. Yet, like the rest of the Prest-O-Lite line, it is priced to offer you the biggest value of the day. Ask your dealer to show you this battery and the Prest-O-Lite Chart that helps you select the right battery for your set. Or write Indianapolis for a copy of our interesting handbook on radio storage batteries and how to charge them.
